

# Systems Integration

**Implement the right system for your enterprise – Worldgate’s customized systems integration services help our clients drive successful implementations.**

We join together with our clients to establish goals which are achieved through cooperative integration of the identified enterprise system. Whether using industrialized technologies or a custom designed solution, we understand that each solution must integrate with existing systems, processes, and people to provide value. Worldgate offers clients the ability to engage our organization for a specific phase of a project or for the entire systems integration lifecycle.

We work face-to-face with our clients throughout our 4 phases of integration:

**Worldgate’s 4 Phase Systems Integration Model**

## 1 INITIATE

The Initiation phase starts with preliminary analysis and knowledge sharing, solution visioning, and project charters.

## 2 PLAN

The Planning phase includes business/systems analysis and design, detailed project planning and comprehensive requirements gathering.

## 3 IMPLEMENT

The Implementation phase initiates the project roll out of the designed and developed solution including training, change management, and system delivery and acceptance.

## 4 SUPPORT

The Support phase includes knowledge transfer training for internal self-sufficiency, production support, upgrades, and continuous evaluation.
